

# Super Control Panel

## Fast way to adjustments

Olympus may not have the most user-friendly menu system, but there is one particular feature Olympus has done right since even the DSLR days: the Super Control Panel (SCP).

To access the SCP, you need to press "OK". If you have different views on the main screen, you need to toggle the "INFO" button repeatedly until you find SCP. That is another reason I disabled the Live Control, I can access the SCP immediately.

**S** SCP is a one page summary layout of all the most frequently used settings of the camera. I find the SCP to be extremely helpful especially to have one quick glance of my current camera settings and make sure I did not screw up or forget to change some settings. The frequently checked settings I have done quickly through SCP are RAW/JPEG, ISO, as well as the Image Stabilization. At the same time, you can immediately access these settings directly and change them accordingly. I make sure I have a

quick look at the SCP from time to time between frames just to make sure I did not accidentally change any settings. This is one of the best implemented shortcut menu system, ever, and has been COPIED (yes you heard that right, Olympus came up with this SCP concept FIRST) endlessly by other manufacturers.

For E-M5 Mark II, the SCP is enabled by default. For E-M1, E-M5 and E-M10, you can enable it by going to Go to custom menu (Display) --> Control Settings --> P/A/S/M --> Live SCP ON
